SUMMARY

QA Automation Engineer / SDET with 3+ years of experience developing automated testing frameworks, testing infrastructure and integration testing solutions for distributed microservice platforms. Specialized in Python automation, REST API, gRPC, Kafka, Kubernetes, CI/CD and test infrastructure development. Currently working as a Senior QA Automation Engineer at Ozon. Previously designed and implemented a Python-based testing ecosystem including API/UI frameworks, FastAPI mock services, CI/CD pipelines and more than 1,200 automated tests for a microservice architecture at Alfa-Bank.

TECHNICAL SKILLS

Programming: Python, SQL

Test Automation: pytest, Playwright, Nuke, Allure TestOps, Jira Zephyr

Backend: FastAPI, requests, Pydantic v2, Beanie ODM, PyMongo, kafka-python

API & Integration: REST API, gRPC, GraphQL, SOAP, Kafka, OpenAPI

Databases: PostgreSQL, MongoDB, Valkey

DevOps: Git, GitLab CI, Jenkins, Docker, Kubernetes, OpenShift, Helm, uv

Observability: ELK Stack, Kibana, Prometheus, Grafana

Architecture: Microservices, SOA, Event-Driven Architecture, Distributed Systems

EXPERIENCE

Ozon

Senior QA Automation Engineer

May 2026 – Present

Employee Profile Ozon Job

- **Project:** Employee Profile — distributed platform responsible for employee profile management, financial information, shifts, courses data and status models. Built on gRPC, REST APIs, Kafka, Kubernetes and sharded PostgreSQL.
- Develop and maintain end-to-end, API and integration tests using Python, pytest and the company's internal Nuke testing framework.
- Extend the existing automation framework, improving maintainability, readability and long-term scalability of the test suite.
- Automate regression testing for newly delivered platform functionality, reducing manual testing effort.
- Design and implement integration tests for services communicating through REST APIs, gRPC and Kafka.
- Investigate failures in distributed test environments, perform root cause analysis and collaborate closely with developers to resolve issues.
- Validate distributed system behavior using Kubernetes, GitLab CI, Valkey and sharded PostgreSQL databases.
- Participate throughout the software development lifecycle to ensure reliable delivery of new platform functionality.

Alfa-Bank

Senior QA Automation Engineer / Python Tooling Developer

Mar. 2025 – May 2026

FX Derivatives Platform

- **Project:** Distributed foreign exchange derivatives platform supporting forwards, swaps and spot transactions for corporate customers. Microservice architecture built around REST APIs, Kafka and Kubernetes.
- Developed a FastAPI-based mock service for emulating external systems, enabling isolated integration testing and flexible negative testing scenarios.
- Built an internal Python service (Zeep, SOAP, REST API, MongoDB) for automated test user provisioning through the ESB, reducing test data preparation time from **1–2 days to approximately 10 minutes**.
- Designed and implemented a Jenkins CI/CD pipeline (Groovy) for automated test execution, Allure reporting and release validation.
- Built from scratch a Python automation framework supporting API, integration and UI testing for a distributed microservice platform.

- Automated up to **90%** of testing for newly developed functionality, including integration, contract and UI test suites.
- Introduced structured JSON logging with trace identifiers and request metadata, significantly simplifying defect investigation and troubleshooting.
- Performed production issue analysis using ELK Stack, Kibana, Prometheus and Grafana.
- Worked extensively with Kubernetes, including Pods, Services, Deployments, Ingresses, Helm Charts and log analysis during system validation and incident investigation.
- Applied Shift Left Testing practices by reviewing business requirements and technical designs before implementation.

Sber

QA Automation Engineer

Oct. 2023 – Mar. 2025

Salute Virtual Assistant

- **Project:** AI-powered virtual assistant for investment and savings products integrated with GigaChat and internal banking services.
- Increased automated test coverage from **65% to 80%** by developing additional unit and integration tests.
- Refactored the existing automation framework using software design patterns, improving maintainability and reducing technical debt.
- Automated validation of an AI intent-classification model, identifying a critical discrepancy between DEV and PROD environments before release.
- Increased overall automation coverage from **60% to 90%**, significantly reducing regression testing time.
- Developed integration tests for microservices communicating through Kafka and REST APIs.
- Mentored junior QA engineers and interns in test automation and CI/CD practices.

PROJECTS

DevMirror  | Python, FastAPI, MongoDB, Kafka, Docker

- Designed and implemented a universal mock service for integration testing of distributed microservice systems.
- Built using Domain-Driven Design (DDD) and Clean Architecture principles.
- Implemented dynamic request matching, scoped mocks, side effects, request logging and Kafka integration.
- Developed an extensible side-effect engine supporting HTTP callbacks, PostgreSQL, MongoDB, Redis and Kafka providers.
- Implemented GitHub Actions CI pipeline with Ruff linting and automated validation.

EDUCATION

MIREA — Russian Technological University

B.Sc. in Laser Engineering and Laser Technologies

Moscow, Russia
